

UFO - Mysterious Aerial Encounter Reported Over Norway

On the afternoon of July 11, 1995, an unusual incident in the skies of Norway drew attention from both aviation professionals and local witnesses. What began as a routine regional flight soon turned into a puzzling encounter that remains unexplained.

At approximately 4:25 p.m., a regional passenger aircraft traveling from Oslo to Brønnøysund was flying over the area near Steinkjer, roughly 70 kilometers north of Trondheim. Weather conditions were ideal, with clear skies and

excellent visibility. It was under these circumstances that the flight crew noticed something unexpected in the air.

The co-pilot was the first to spot the object, observing it moving near the right side of the aircraft. Initially, the crew assumed it might simply be another airplane in the vicinity. However, as the captain leaned forward to get a better look, he realized that the object did not resemble a conventional aircraft.

According to the captain, the object lacked visible wings and tail structures—features normally present on any standard airplane. The encounter was brief, lasting roughly a minute. During that time, the object reportedly slowed down before suddenly disappearing from sight.

Following the sighting, the crew promptly reported the incident to the air traffic control tower at Værnes. While stray weather balloons can sometimes be mistaken for unidentified aerial objects, no confirmation was made that such equipment was present in the area at the time. Military radar installations near Trondheim were monitoring the region, yet no unknown target appeared on their systems. Authorities also confirmed that no military aircraft were operating in the area during the incident.

Interestingly, the flight crew was not the only witness. An 11-year-old boy living in the region later told his parents that he had seen a strange object in the sky from the porch of his home earlier that evening. He described it as a highly polished object, nearly the size of an airplane. According to his account, it remained visible for about half a minute before shooting upward and vanishing at remarkable speed.

Later that same evening, another local resident, a 75-year-old man, reportedly observed a similar silvery object in the sky several hours after the initial event.

Despite multiple testimonies, no definitive explanation has ever been established. With no radar confirmation and no known aircraft matching the description, the event was ultimately categorized by authorities as an unidentified aerial phenomenon—one of many mysteries that continue to intrigue observers of unusual occurrences in the sky.
